

Discoglossus galganoi

Taxonomic Authority: Capula, Nascetti, Lanza, Bullini and Crespo, 1985

Synonyms:

Discoglossus hispanicus Lataste, 1879

Order: Anura

Notes on taxonomy:

Region: 10

Common Names:

Iberian Painted Frog English

Sapillo Pintojo Ibérico Spanish

Family: Discoglossidae

General Information

Biome

Terrestrial

Freshwater

Marine

Geographic Range of species:

The species is endemic to the Iberian Peninsula (Portugal and most of western Spain), where it is found at altitudes ranging from sea level to 1,940m asl (Piedrahita, Spain).

Conservation Measures:

This species is listed on Appendix II of the Berne Convention and is also listed on Annex IV of the EU Natural Habitats Directive. The species is protected by national legislation in Spain and is listed in the Spanish national Red Data Book. It has been recorded from Doñana, Islas Atlánticas de Galicia, and Cabañeros National Parks, Spain.

There is a need to further clarify the distribution of this species and the related *Discoglossus jeanneae*.

Species population information:

In Spain, it is abundant over much of its range (with the exception of the northeastern populations), while in Portugal the species may be locally abundant in fragmented populations.

Habitat and Ecology Information:

It is generally found within or in the direct vicinity of water (with surrounding dense vegetation), including still waters, swamps, mountain streams, drinking troughs and sometimes-brackish waters. The terrestrial habitats of the species occur on granite and other metamorphic rocks, and include sandy areas close to the sea, open areas, meadows, thickets, gulleys and woodland edges. The species breeds, and larval development takes place, within shallow permanent or temporary waterbodies. It is often present in slightly modified areas, such as traditional farmland.

Threats:

The main threats to this species are both a general intensification of agriculture and the introduction of predatory fishes and crustaceans (especially the Louisiana Crayfish - *Procambarus clarkii*) through much of the species range. Desertification is a threat to the species in the more arid parts of its range such as southern Portugal. Additionally, hydroelectric projects are leading to habitat loss in parts of Portugal. However, overall this species is probably not seriously threatened at present.

CITES: Not listed

Red Listing

Red List Assessment: Least Concern (LC) Possibly Extinct

Red List Criteria:

Rationale for the Red List Assessment: Listed as Least Concern in view of its wide distribution, tolerance of a degree of habitat modification, presumed large population, and because it is unlikely to be declining fast enough to qualify for listing in a more threatened category.

Current Population Trend: Decreasing

Date of Assessment: 12/17/2004

Assessor(s): Jaime Bosch, Pedro Beja, Miguel Tejedo, Miguel Lizana, Iñigo Martínez-Solano, Alfredo Salvador, Mario García-París, Ernesto R
